TECHNICAL DATASHEET

WHITE MONOFILAMENT EGG CONVEYOR BELT

Our lightweight egg conveyor belting systems are made of high-tenacity polypropylene yarns, offering greater elongation resistance than raw material used in the manufacture of competing conveyor belts. This makes our BH AR belts a product with the best quality and price-performance ratio on the market.

Polypropylene (PP) is widely used in various industrial applications due to its versatility. Recyclability and hypoallergenicity are some of its intrinsic features. Through its fabric, the BH AR belts are able to guarantee the absorption of broken eggs while keeping the cleanliness of the rest of the whole eggs during its transport.

Naturally, polypropylene yarn inhibits the growth of bacteria and fungi and thus keeps rot at bay. In other words, being a polymer, it does not absorb water nor does it retain moisture. It is water-repellant; that is, it is hydrophobic!

In addition, it withstands the most severe weather conditions and is chemically resistant – it can tolerate

acidity and alkalinity very well. It has excellent resistance to UV rays so it does not fade in sunlight. Thanks to its high tensile strength, it remains homogeneous throughout its useful life. PP is one of the lightest polymers among all commodity synthetic fibers.

As part of cage maintenance, belts can be washed in cold water when necessary. Although our conveyor belts are anti-static – keeping dust away –, it is unadvisable to leave the side row belts of open-sided poultry houses directly exposed to the effects of sunlight with no curtains or sunscreen, as direct and continuous exposure to the rays of the sun can cause their premature aging.
